

CASE #1

Automated Sales Contract & Document Lifecycle System

Problem:

Manual generation of contracts, pricing sheets, and client documentation created significant administrative overhead for the sales team, slowed deal progression, and increased the risk of operational errors.

Solution:

Designed and implemented an end-to-end automated document generation and contract lifecycle system using Make, Pipedrive, PandaDoc, and SharePoint.

TOOLS

Make.com · Pipedrive · PandaDoc
SharePoint

IMPACT

- 70% reduction in manual document processing time
- 4 document types fully automated
- Faster sales cycle through instant contract generation
- Standardized contract storage and signature governance

FEDOR SAVELEV

CASE #1

Automated Sales Contract & Document Lifecycle System

System Architecture:

Event-driven workflow triggered by Pipedrive deal updates, dynamically generating 4 document types via PandaDoc templates with automated data aggregation (deal, client, company, services), conditional routing, and end-to-end document delivery, tracking, and SharePoint storage after signature completion.

Key Technical Components:

- Workflow orchestration & event-driven automation
- CRM ↔ document lifecycle integration
- Dynamic template population (PandaDoc)
- Multi-step approval and storage pipeline
- Compliance-aware document management (SharePoint)

CASE #2

GHL Omnichannel Spam Detection & Auto-DND System

Problem:

Inbound messages across SMS, email, Facebook, Instagram, and Google Business messages contained a high volume of spam (ads, links, irrelevant offers), reducing agent productivity and polluting CRM contact workflows.

Solution:

Built an AI-powered real-time spam detection system integrated into GoHighLevel that classifies inbound messages and automatically applies Do-Not-Disturb (DND) rules across all communication channels when spam is detected.

TOOLS

Make.com · GoHighLevel · Gemini AI
Google Sheets

IMPACT

- Reduced manual spam handling workload by 80-90%
- Automated spam filtering across 5+ communication channels
- Improved CRM data quality by reducing irrelevant inbound noise by ~70%+

Enabled real-time enforcement of communication rules at contact level

FEDOR SAVELEV

CASE #2

GHL Omnichannel Spam Detection & Auto-DND System

System Architecture:

Every inbound message event from GoHighLevel (SMS/email/social channels) is sent to an automation layer (Make/n8n), which enriches the request with contact and location data, then forwards it to Gemini AI for classification. The model returns a structured JSON decision (spam / not spam). If classified as spam, the system automatically triggers CRM-level actions including DND activation, contact tagging, and owner notifications. All spam cases are logged into Google Sheets for audit and monitoring.

Key Technical Components:

- Multi-channel inbound event ingestion (GHL)
- AI-based message classification (Gemini AI)
- Structured JSON decision pipeline
- CRM automation (DND activation, tagging, updates)
- Cross-channel enforcement logic
- Audit logging system (Google Sheets)
- Workflow orchestration in Make/n8n

TOOLS

Make.com · GoHighLevel · Gemini AI
Google Sheets

IMPACT

- Reduced manual spam handling workload by 80–90%
- Automated spam filtering across 5+ communication channels
- Improved CRM data quality by reducing irrelevant inbound noise by ~70%+
- Enabled real-time enforcement of communication rules at contact level

CASE #3

FEDOR SAVELEV

CRM Deal & Task Migration System

Problem:

When sales owners were deactivated or changed, deals and associated tasks in HubSpot had to be manually reassigned. This created inconsistencies in ownership, lost context on active deals, and required significant manual effort to clean up CRM data.

Solution:

Developed an automated CRM migration system triggered from a ClickUp form that transfers deals and tasks from an old owner to a new owner, applying business rules for distribution between reassignment and backlog prioritization.

TOOLS

Make.com · ClickUp · HubSpot

IMPACT

- Reduced ownership migration time by 90–95%
- Eliminated manual CRM reassignment across deals and tasks
- Improved CRM data consistency and ownership accuracy by ~100% during migration events
- Reduced operational downtime during team transitions by 80%+

CRM Deal & Task Migration System

System Architecture:

Event-driven workflow initiated from ClickUp form input (old/new owner). System extracts all related deals and tasks from HubSpot, applies conditional routing logic, performs batch reassignment, updates CRM records, and sends automated completion/error notifications.

Key Technical Components:

- Event-driven CRM migration workflow
- HubSpot bulk data extraction & updates
- Conditional routing logic for business rules
- Batch processing of CRM objects
- Ownership reassignment automation
- Error handling & notification layer

TOOLS

Make.com · ClickUp · HubSpot

IMPACT

- Reduced ownership migration time by 90–95%
- Eliminated manual CRM reassignment across deals and tasks
- Improved CRM data consistency and ownership accuracy by ~100% during migration events
- Reduced operational downtime during team transitions by 80%+

CASE #4

Sales Performance Leaderboard & Reporting System

Problem:

Sales performance data was available in HubSpot dashboards, but it lacked real-time visibility and was not actively used by the team on a daily basis. As a result, performance insights (closed deals, conversions, revenue per manager) were underutilized for motivation and operational awareness.

Solution:

Built an automated system that extracts sales performance data from HubSpot, calculates key KPIs, and distributes daily and weekly leaderboard summaries directly into Slack to increase visibility, engagement, and team accountability.

TOOLS

Make.com · Slack · HubSpot

IMPACT

- Increased sales performance visibility from passive dashboard usage to daily active exposure (100% distribution automation)
- Eliminated manual reporting efforts (~100% automation of KPI reporting process)
- Improved team engagement through continuous performance feedback loop

FEDOR SAVELEV

CASE #4

Sales Performance Leaderboard & Reporting System

System Architecture:

Scheduled workflows retrieve deal and pipeline data from HubSpot, compute sales KPIs per manager (daily and weekly), generate leaderboard rankings, and publish formatted updates into Slack channels. System runs on both daily and weekly cycles to maintain continuous performance feedback loops.

Key Technical Components:

- Scheduled HubSpot data extraction
- KPI calculation engine (deals, revenue, conversion rates)
- Leaderboard generation logic
- Slack automated messaging integration
- Time-based reporting pipelines (daily / weekly)
- Data aggregation and formatting layer

TOOLS

Make.com · Slack · HubSpot

IMPACT

- Increased sales performance visibility from passive dashboard usage to daily active exposure (100% distribution automation)
- Eliminated manual reporting efforts (~100% automation of KPI reporting process)
- Improved team engagement through continuous performance feedback loop

AI-Powered Lead Enrichment & Outreach System

Problem:

LinkedIn Sales Navigator exports required manual handling, multi-source email verification, and campaign setup in Smartlead. The process was fragmented and required manual intervention at multiple stages, limiting scalability of outbound operations.

Solution:

Built an automated lead enrichment and campaign preparation pipeline with multi-provider email verification, AI-driven personalization, and structured handoff points for human approval before campaign activation.

TOOLS

n8n · Baserow · Smartlead · Dropcontact
· Datagma · Fullenrich · Gemini AI

IMPACT

- Reduced lead processing effort by 80-90%
- Automated ~90% of outbound campaign preparation workflow
- Increased outreach-ready lead throughput by 3-5x per batch
- Improved data quality through multi-source email verification
- Introduced controlled human approval stage for campaign safety

AI-Powered Lead Enrichment & Outreach System

System Architecture:

LinkedIn Sales Navigator files are manually imported into Baserow as the initial entry point. From there, an automated pipeline processes each lead through a waterfall email verification system (Dropcontact → Datagma → Fullenrich), followed by AI-generated personalized outreach content using LLMs. After enrichment and validation, a Smartlead campaign is automatically prepared and populated with verified leads. The final campaign activation step remains manual to ensure human approval before sending outbound sequences.

- Key Technical Components:**
- Manual file ingestion (LinkedIn → Baserow)
 - Multi-provider email verification waterfall
 - Lead enrichment and normalization pipeline
 - AI-based personalized email generation (LLMs)
 - Automated Smartlead campaign preparation & population
 - Human-in-the-loop campaign activation gate
 - Workflow orchestration via n8n

TOOLS

n8n · Baserow · Smartlead · Dropcontact · Datagma · Fullenrich · Gemini AI

IMPACT

- Reduced lead processing effort by 80-90%
- Automated ~90% of outbound campaign preparation workflow
- Increased outreach-ready lead throughput by 3-5x per batch
- Improved data quality through multi-source email verification
- Introduced controlled human approval stage for campaign safety

CASE #6

AWB Generation & Parcel Monitoring System

Problem:

AWB (air waybill) files for shipments were generated inconsistently and required manual verification across multiple parcels. There was no reliable system to track newly created shipments or ensure timely notification to the control team.

Solution:

Built an automated AWB monitoring and generation pipeline that periodically checks for new shipments, extracts relevant data via authenticated session automation, stores state in a database, and distributes generated AWB files to the control team.

TOOLS
n8n · PostgreSQL · Selenium · EasyPanel
· Email (SMTP) · custom scripts

IMPACT

- Automated monitoring of shipment generation process (100% elimination of manual checks)
- Improved tracking reliability for new AWB creation
- Reduced operational latency in notifying control team
- Ensured consistent detection of new parcels via scheduled polling system

FEDOR SAVELEV

AWB Generation & Parcel Monitoring System

System Architecture:

Every 15 minutes, an n8n workflow triggers a Selenium-based authentication script to access the shipping system and retrieve the latest ~40 parcels. The system checks each parcel against PostgreSQL to identify new entries, stores newly detected AWB records with download links, and sends batch email notifications to the control team. Duplicate entries are filtered at database level to ensure idempotency.

Key Technical Components:

- Scheduled polling system (15-minute intervals)
- Selenium-based session authentication automation
- Parcel data extraction pipeline
- PostgreSQL-based deduplication & state tracking
- File link management system
- Batch email notification workflow
- Self-hosted deployment (EasyPanel + Docker)

TOOLS

n8n · PostgreSQL · Selenium · EasyPanel
· Email (SMTP) · custom scripts

IMPACT

- Automated monitoring of shipment generation process (100% elimination of manual checks)
- Improved tracking reliability for new AWB creation
- Reduced operational latency in notifying control team
- Ensured consistent detection of new parcels via scheduled polling system

CASE #7

Proposal Intake & CRM Entity Resolution System

Problem:

Proposal records often lacked standardized client, company, and representative information, leading to inconsistent CRM records, duplicate contacts, and fragmented sales data.

Solution:

Built an automated proposal intake and entity resolution system that collects structured project data through custom Monday forms and synchronizes proposal, contact, and company records through dynamic matching and linking logic.

TOOLS

Make.com · Monday.com

IMPACT

- Reduced manual proposal data entry effort by 80–90%
- Improved CRM record consistency across proposals
- Reduced duplicate contact/company creation
- Increased data quality and sales pipeline transparency

FEDOR SAVELEV

CASE #7

Proposal Intake & CRM Entity Resolution System

System Architecture:

A custom Monday form is launched from proposal records using proposal-specific query parameters. Submitted data populates proposal fields, then workflows perform contact and company matching against CRM boards using identifiers such as email, phone, and company name. Existing entities are updated when matches are found; otherwise, new records are created and linked automatically to the originating proposal.

Key Technical Components:

- Custom Monday.com form infrastructure
- Proposal-linked dynamic intake workflows
- Contact and company entity resolution logic
- Deduplication via multi-criteria matching
- Relational CRM linking system
- Automated record creation/update workflows
- Structured sales data normalization

TOOLS

Make.com · Monday.com

IMPACT

- Reduced manual proposal data entry effort by 80-90%
- Improved CRM record consistency across proposals
- Reduced duplicate contact/company creation
- Increased data quality and sales pipeline transparency
